

INSTALLATION INSTRUCTIONS

1. The Lithium batteries are to be installed as pairs and aligned with the **same** polarity.
2. Installing the batteries in opposite polarity will cause issues with the added potential of circuitry 'burning' out.
3. The batteries can be charged in the **SPiN turntable system** but it is advised not to have them charging while in use but charge when on.
4. It is recommended to use an external charging unit that has fail-safe operation, like the [Nitecore i2 Intellicharger](#).
5. It is recommended not to drain the batteries down to 'no charge'. Always ensure the batteries are fully charged before installing into the **SPiN turntable system**.
6. If the batteries have no or little charge and are installed into the **SPiN turntable system**, then the unit will still function, however, certain functionalities of the **SPiN turntable system** may not perform correctly, as the circuitry is designed to place full focus on charging the cells in the first instance, rather than the Bluetooth functionality to be operational for example.
